(1) Describe the purpose of this DoD information system or electronic collection and briefly describe the types of personal information about individuals collected in the system.

The Army Reserve Transaction Management System (ARTRAMS) consists of programs that perform batch operations to update TAPDB-R and to send to other components. ARTRAMS formats transactions to update personnel data on TAPDB-R through RDMS. Information for the transactions is received from multiple automated systems and sources, to include RICS, MOBPERS, AORS, and MEDPROS. The ARTRAMS portion of RDMS, implemented in Jul 94, formats update and new gain transactions to interface with TAPDB-R systems. Upon request or whenever a soldier transfers to another component, ARTRAMS formats ICDD transactions to interface between the USAR and other components in support of the development of Army-wide ICDD capability. Personal information contained in the system includes all data required to perform the broad spectrum of personnel management for active Reserve Soldiers, Retirees and in some cases, discharged Soldiers. PII retrieved include personal, and work related.

(2) Briefly describe the privacy risks associated with the PII collected and how these risks are addressed to safeguard privacy.

All systems and environments have threats that seek to exploit and cause harm to the information. Some threats are natural, some are inherent in the system design, some can be attributed to unauthorized personnel, and some to authorized personnel who make mistakes. Four general categories of threats exist: human-intentional, human-unintentional, structural, and natural. The system is maintained in a controlled facility. Appropriate technical, personnel, physical and operational safeguards are in place for the access, collection, use and protection of information. Due to the level of safeguarding, we believe the risk to individuals' privacy to be minimal.
